Research Profile

PhD researcher in theoretical cosmology working across inflation, quantum cosmology, modified gravity, black-hole physics and cosmological tensions. My research combines analytic model building with gravitational dynamics and phenomenology, with particular emphasis on connecting fundamental physics to falsifiable cosmological or strong-gravity signatures. I have **7 peer-reviewed publications (5 first-author)**, including papers in *JCAP*, *Physical Review D*, *Physics Letters B*, *Physics of the Dark Universe* and *European Physical Journal C*, together with an accepted cosmology manuscript and recent preprints on inflationary initial conditions, quantum cosmology and the Hubble tension.

Research Interests

Inflation and its initial conditions; quantum cosmology and the Wheeler–DeWitt equation; primordial black holes and early-Universe dynamics; modified gravity and geometric extensions of GR; black-hole lensing and quasinormal modes; cosmological tensions and model-independent tests of the expansion history.

Education

Ongoing **PhD Candidate in Theoretical Cosmology**, National Technical University of Athens & National Observatory of Athens. Thesis: *Investigating gravity in light of modern cosmological tensions*.
MSc in Nuclear and Particle Physics, National and Kapodistrian University of Athens, Department of Physics. Thesis: *Weyl Geometries and Holographic Renormalization in AlAdS Manifolds*. **Grade: 10/10**.
BSc in Mathematics, National and Kapodistrian University of Athens, Department of Mathematics. Track: Theoretical Mathematics.

Research Experience & Scientific Service

- **PhD Researcher, NTUA / National Observatory of Athens:** early-Universe cosmology, modified gravity, quantum cosmology, black-hole perturbations, gravitational lensing and cosmological phenomenology.
- **Ad hoc referee:** *Physics of the Dark Universe*, *Physics Letters B*, *Nuclear Physics B*, and *Journal of Modern Physics*.
- Contributor to the **CosmoVerse White Paper** on observational tensions in cosmology (*Phys. Dark Univ.* 49, 101965, 2025), including work connected with modified-gravity approaches to cosmological tensions.

Research Highlights

- Developed a ghost-free Weyl-geometric modified-gravity construction with second-order field equations and cosmological applications.
- Built inflationary models with strongly suppressed primordial tensor amplitudes while retaining viable slow-roll dynamics and reheating.
- Connected quantum-cosmological wave functions and Bohmian trajectories to cosmological expansion, and developed a dynamical mechanism for preparing plateau-inflation initial conditions.
- Investigated observable strong-gravity signatures through black-hole lensing, geodesic instability and quasinormal-mode decay, and early-Universe signatures through primordial-black-hole formation.

Technical Skills

Scientific computing/typesetting: Mathematica, MATLAB, L^AT_EX; symbolic and numerical modelling; finite-difference methods. **Languages:** Greek, English, French.

Complete and updated publication list supplied separately.

Teaching & Scientific Communication

- Mathematics and physics teaching/tutoring, including special relativity, general relativity and cosmology; previous mathematics teaching appointment at Ionios School.
- **Mensa International member with the highest possible score**; delivered lectures for Mensa including “Proof of planets’ elliptic orbit” (2022) and “Cosmology: The Art of Understanding the Whole” (2025), alongside seminars for advanced/gifted students on modern physics.
